

Rehab Lloydminster

Rehab Lloydminster - EECp therapy is a relatively new outpatient treatment utilized for heart failure and angina. Sufferers of heart ailments may find the basic daily activities rather tough. Activities like walking the dog or getting the mail may present certain difficulties. If you or someone you know experiences heart failure or angina, the non-invasive treatment known as EECp therapy can prove beneficial. Statistics prove that about 80% of individuals who complete the 35 hour course of EECp therapy report significant symptom relief which may last up to 3 years.

EECP therapy has been proven useful for heart failure and angina treatment. Treatments could be given for an hour a day, up to 5 days a week for as much as 35 hours. A treatment would normally require lying on a table using large blood pressure like cuffs wrapped around your legs and buttocks. At certain times in between your heartbeats, these cuffs inflate and deflate. A continuous ECG or electro cardiogram is utilized to set the timing. This insures that the cuffs inflate while the heart is in its resting state where it usually receives its supply of oxygen and blood. Afterward the cuffs deflate at the end of that rest period, just prior to the next heartbeat. The patient wears a special sensor on their finger to monitor the oxygen levels in their blood. The sensor also checks the pressure waves created by the cuff inflations and deflations.
